Question: Is technology making us less capable of concentrating, thinking deeply, and learning effectively, or are we simply learning to use our attention in different ways?

- In the episode "Are New Media Shortening Attention Spans: How Digital Technology Shapes Us" is presented, precisely, the idea that the New ways of technology can configurate our attention spans. One of the video's main ideas is that, according to some scientific studios, the way our brains work can change if we are constantly exposed to New Media. Thus, the content we consume is becoming shorter and shorter, for this reason the brain cannot maintain as concentrated as it used to mantain. ✓

Furthermore, in this episode is presented the concept of being multitasting, wo Although multitasking has been a really good way to resolve a bunch of things at the same time, the human brain is not designed to work on such a x way. It is meant to keep the attention at once in a specific task.

For instance, as a student I have found myself in situations where It is more difficult to pay attention. I am aware about my problematic adiction to social media because it has affected my life on other aspects, I feel bored really easy and now it is difficult to complet SP tasks.

Finally, I think that, in order to improve our ability to concentrate, we have to be counscious about the bad technological habits we are used to and try to change that. Then P we can look forward to ways

in which we can rehab our brains, such as letting ourselfs SP - CH bored for at leart one hours or keeping our time by doing concentration-required tasks, for example reading.

GOOD!
