Valeria García

Technological devices have taken the control over our actions and even our thoughts. With the invention of artificial intelligence and search engines, it has become more difficul(sp) for people to think by themselves and to control what they pay attention to because technology gets to decide for us what to think and what it(x) is important. For this reason, I consider technology is making us less capable of concentrating, thinking deeply, and learning effectively.

In first place, we are losing our attention spans and our critical thinking because everything is purchasable now. Companies such as Tiktok, Temu, Meta, have found the way to buy our attention by content and products that are easy to get, that do not require much effort neither to understand nor to acquire them. From my own experience, it is easier to focus on what gives instant fun or relieve, which not only reduces my capability of paying attention to other things, but also makes my brain lazier when thinking.

In second place, as explained in the episode, our attention is a limited resource which can be easily divided in different things but also in different levels which do not guarantee that our brain is going to keep the information in a long term. By constantly being exposed to fast and simple content, and ideas, we tend to need less and less information, vocabulary and understanding to use social media or even to interact with other people, this can be very dangerous because we reduce the capability of(?) our brains to think beyond the information presented and to remember those things we have just been exposed to. This can happen

for example, when we start forgetting some words or some information because we know we can easily find it on internet, or because the reduced vocabulary that it is used in the things we consume.

As one of the possible ways to improve this, I will suggest to watch more conscious content in which there are uncommon words or even topics that force our brain to work beyond of what is presented.

Good!

I enjoyed reading your ideas.
