The increasing access to technology has created changes in the ways in how human beings concentrate, think deeply and learn.

On one side, we have forgotten that learning is a full and complex process that is unfinished, as we are always learning different aspects of the life and specific subjects. Moreover, in this complex process it is meddling the development of our ability to think deeply. Sometimes, due to the access to technological tools, we are more focused on the subject rather than internalize what we have learnt.

Related to concentration, on the other side, due to the overinformation and overstimulation in which we are immersed all the time because of technology, there is a weakening of that ability. Our brain is very adaptable and so

it has the facillity to adopt to changes, Yes, it is not the same for all people, but if we give constant dopamine to our brain and system, surely it is going to overstimulate us and won't allow us to concentrate easily.

As a technological user, based on my experience I say that sometimes I have overstimulate my system with reels and after those sessions of exposure I have felt tired, and it has been difficult to retake a duty or important thing for me.

Related to advices, based on my experience to concentrate I ask you to look for the Pomo theory of concentration, it will give you a general background of how your periods of concentration work. Moreaver, try to avoid watching tiktoks or reels for long periods of time, go out, breath, talk with your friends and learn new interesting things. Please, watch stylish

GOOD / AVERAGE !
