Juan David Gutierrez Sierra Essay 03/11/26

In the episode "Are New media Shortening Attention Spans? How Digital Technology Shapes us" we can see how our brains work and are affected by technology.

First, in the episode, the presenter said that we can get distracted easily: for example, if someone makes us realize that we can feel our clothes or breathe manually, our brains start feeling that. Other aspect is that Social media is a great distractor for us as we have many information and content in just seconds, which makes us think in several things and not in just one. Furthermore, the episode says that multitasking can generate mental overload as long as we are spending attention in several things virtually. Besides, human brain is not prepared and designed for that, that's why we can feel stressed or overwhelmed. Technology is making us less capable of concentrating, thinking and learning because of the constant exposure to distractors and unlinked information.

As a student and technology user, what I said before has affected my ability to study and learn effectively. For example, when I try to study or read, there are ads in the websites I visit and people start texting me, so I lose focus in what I'm doing.

Personally, I think it is a good idea to Reflect on that and turning off the notifications and any other distractor to keep our attention properly.
