Fabiana Sofia Martinez Rojas:

Technology nowadays is shaping the way we live and interactuate with other people, it is even affecting our capability to concentrate, think, or even learn in a good way.

The episode of Kanopy about technology shows or questions, how technology is involving us and changing our lives, additionally it explains the ideas of different thinkers about what attention really is. For instance, it shows the example of people interacting among them in a cocktail party and shows the ability of brains to filter what we have to listen or just what is consider as "the background noise".

Furthermore, this episode talks about how multitasking work in the human brains. It is said, that the brain just learns how to manage different things at the same time but with a filter

with the managed things. For example in the routine, we have developed the ability to manage our phone doing almost everything, like cooking, watching TV, talking to people or even in the bathroom. The technology and social media, in my opinion, is not helping us, it is reducing our brain's ability, our brain wants to keep active or burdened with different things at the same time. However, we need to stop doing many things at once, we need to try stopping the actions that decrease our ability to think or manage things, we should stop watching short videos or clips, to improve again our attention, get some free time from technology or stop being "MultiTasKing" to do the things better and not conforming us with things done mediocrely.

GOOD!
