Ximena Ruiz García.

Nowadays, the technological advancement reshaped the way we received (SP) the information and the way that we process it. Aspects such as be (GR) less capable of concentrating thinking deeply and learning effectively are ideas that are being discussed today in terms of how our mind works with the new content and the advancement of technology. This essay has the purpose to explain important ideas about the aspects mentioned before and give some examples and suggestions.

To start, some experts mention that we are not able to control our minds even if we thought that we did, because we are not conscious about what attention is, when we are talking with a friend, for example, we are thinking in (WW) other aspects such as our clothes, our responsabilities (SP) or if we are hungry. The same process is happening with our mind when it is exposed to social media or videos, so we (GR) scrolling all day but we don't pay (x) deeply attention of the content, our mind is not available to do multitasking activities if we are not conscious about what we are doing.

In my experience, I agree with that idea because when I am watching videos on (+) screen I think about other things. and if the video is really long I prefer to put in major (GR) speed or skip it. Because we are more attentive to different things more than what we are doing in the moment.

However, I believe we can start doing some activities to

train our mind but not on screens, preferible (SP) to do + wordsearch or + crosswords on the news ~~to~~ to be concreted (?) and focus our attention in (WW) those activities.

To conclude, technology reduces the way ~~to~~ (X) we catch + attention, because we (WC) nowadays want ~~to~~ access easier to the information, but it depends (GR) of our control.
