Miguel Ángel Torres González

We are learning to use our attention in different ways, According with the episode that we watched in class, the concept of "concentration" doesn't exist clearify and the way of how the brain works is different in each situation and context.

I think nowadays the social medid is changing the way of how we saw the life because when we did the exercise to "scroll" it fastest and our brains are engaging to that fast life, that means that is not the guilt of the tecnology is only that as we are a lot of envolving our brain is doing his best work to solve and understand the boom of information that it recieves. In Addition those waves of information and News are Presented with a lot of Encouragement that overstimulate the brains

And when people confront text or videos that don't have those encouragement the brain Prefer GR focused WW in another things.
In my case P + happens only when the texts that I have to read use complex words and I have to search the meaning and in that simply GR action my brain dissapier SP-GR for the text.
One activity that helps me to improve that "problem" (I is solve GR puzzles As Sudokus, cross words, card game GR (solitario etc) that make my brain to take a breathe and try to process the information and give a possible solution.
